

Authorization

As a state PDMP administrator, authorization is configured in two steps.

Step #1: Administrator first selects the PDMP states which are allowed to query their state. In the below example, *Selected Sites* represent the states allowed to query test state “GG”.

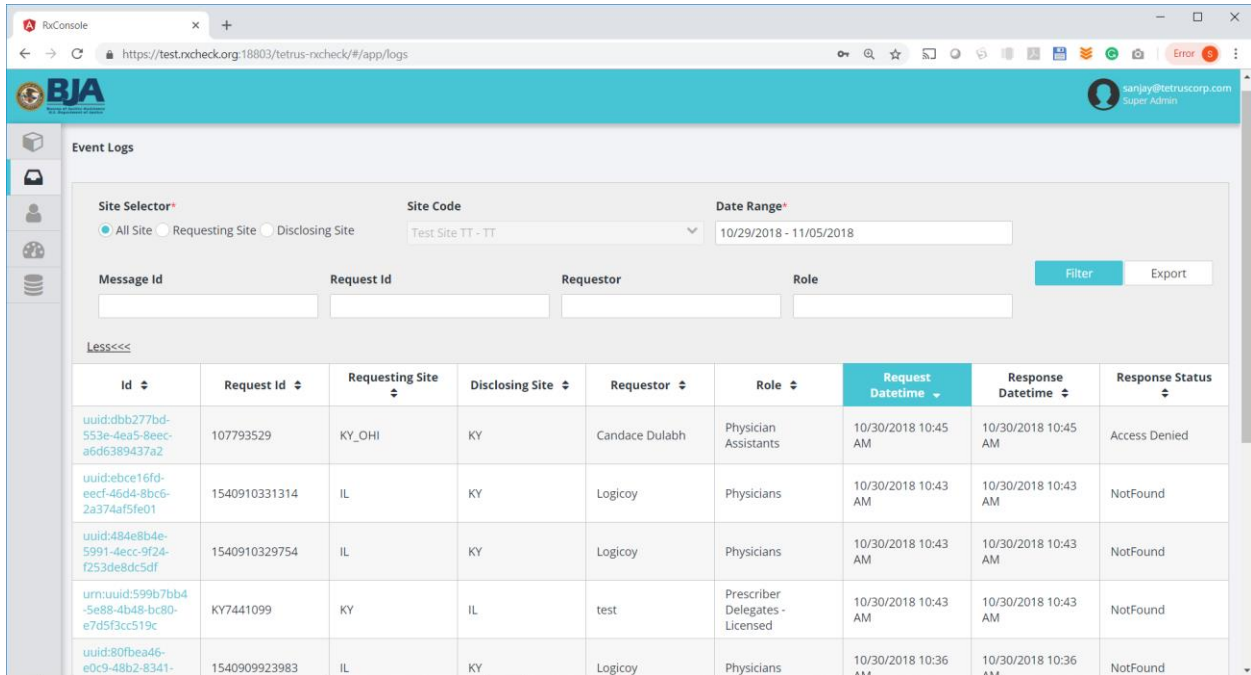

Step #2: Second, for each allowed PDMP state, administrator can authorize specific role(s). In the below example, *Selected Roles* represent the roles allowed from KY to query test state “GG”.

Event Logging

Based on the authorization configuration, RxCheck HUB will allow or reject the transaction.

All transactions are logged in the RxCheck HUB for PDMP administrators to monitor traffic.

The screenshot displays the RxConsole Event Logs interface. At the top, there is a navigation bar with the BJA logo and a user profile for 'sanjay@tetruscorp.com Super Admin'. Below the navigation bar, the 'Event Logs' section is active. It includes a 'Site Selector' with radio buttons for 'All Site', 'Requesting Site', and 'Disclosing Site'. The 'Site Code' is set to 'Test Site TT - TT' and the 'Date Range' is '10/29/2018 - 11/05/2018'. There are input fields for 'Message Id', 'Request Id', 'Requestor', and 'Role', along with 'Filter' and 'Export' buttons. A 'Less<<<' link is visible above the table. The table itself has the following columns: Id, Request Id, Requesting Site, Disclosing Site, Requestor, Role, Request Datetime, Response Datetime, and Response Status. The data rows are as follows:

| Id | Request Id | Requesting Site | Disclosing Site | Requestor | Role | Request Datetime | Response Datetime | Response Status |
